HIGHLIGHTS

This report summarizes selected results from 1,121 Fall River/New Bedford respondents participating in the 1997, 1998, and 1999 Massachusetts BRFSS. The following represent selected areas of interest for Fall River/New Bedford, as it compares to the state-wide average and results from previous years.

Fall River/New Bedford was doing about the same as the state overall with regard to the following health risks and behaviors:

- ❖ attempts to quit smoking in the past year, among current smokers
- ❖ 60 or more drinks in the past month (heavy drinking)
- ❖ overweight and obese adults
- ❖ adults with high blood pressure
- ❖ Pap smear in the past three years, among all women

Fall River/New Bedford was not doing as well as the state overall with regard to the following health risks and behaviors:

- ❖ adults with diabetes
- ❖ current smoking
- ❖ fair or poor overall health
- ❖ adults with disability or limitation
- ❖ adults with no health insurance

Fall River/New Bedford has improved since 1994-1996 with regard to the following health risks and behaviors:

- ❖ support for smoke-free restaurants
- ❖ ever had mammogram, among women ages 40 and older
- ❖ mammogram in the past two years, among women ages 50 and older
- ❖ ever had Pap smear, among all women
- ❖ Pap smear in the past three years, among all women

INTRODUCTION

WHAT IS THE BRFSS?

The BRFSS collects data on a variety of health characteristics, risk factors for chronic conditions, and preventive behaviors.

The Behavioral Risk Factor Surveillance System (BRFSS) is a continuous, random-digit-dial, telephone survey of adults age 18 and older, and is conducted in all states as a joint collaboration between the U.S. Centers for Disease Control and Prevention (CDC) and state departments of health. The survey has been in the field in Massachusetts since 1986. The BRFSS collects data on a variety of health characteristics, risk factors for chronic conditions, and preventive behaviors. The information obtained in this survey assists in identifying the need for health interventions, monitoring the effectiveness of existing intervention and prevention programs, developing health policy and legislation, and measuring progress toward attaining state and national health objectives.

ABOUT THIS REPORT

This report summarizes selected results from 1,121 Fall River/New Bedford respondents participating in the 1997, 1998, and 1999 Massachusetts BRFSS. For each topic, we first present overall percentage estimates of key variables followed by percentage estimates in specific demographic groups. This section allows us to assess whether there are specific groups of adults who are at risk for chronic conditions or who are more likely to participate in healthy behaviors. It is important to note that these data are not adjusted for age or other differences across these characteristics; for example, adults of lower income may be more likely to report fair or poor health. However, age is a strong predictor of health status, and adults of lower income are more likely to be older. Therefore, some of the differences in health status are actually due to differences in age.

Following the core section, we compare the 1997 to 1999 results in Fall River/New Bedford to those of Boston, Springfield, Worcester, and Lawrence/Lowell. The estimates for Fall River/New Bedford are also compared with the state-wide average. Additionally, wherever possible, we compare Fall River/New Bedford's estimates to the goals and objectives set by Healthy People 2010*, as well as the U.S. median* estimate for 1997 to 1999. For national comparisons, we provide the median percent for all fifty states, the District of Columbia, and Puerto Rico. In cases where there are only U.S. estimates for two of the three years, the mean of those two values serve as the U.S. estimate for comparison purposes. If none or only one value was available for the three year span, the corresponding U.S. estimate for that variable has been omitted. Following the city to city comparisons, wherever available, we provide a comparison to the 1994-1996 Fall River/New Bedford estimate, as reported in the BRFSS report for those years. The full-text version of the 1994-1996 Fall River/New Bedford report is currently available on our website, at <http://www.state.ma.us/dph/bhsre/CDSP/brfss/Brfss.htm>.

This report provides estimates for 1997 to 1999 data, compares Fall River/New Bedford with other selected cities, Massachusetts estimates, U.S. data and Healthy People 2010 Objectives.

Due to a limited number of respondents, certain demographic characteristics have required consolidating strata or groups in order to provide more accurate estimates and reduce variability. For example the race /

ethnicity groups have been divided into two groups in all cases (white non-Hispanic, all other), as well as the more specific groupings of Black non-Hispanic, Hispanic, and other ethnicity, whenever the data could support these subcategories. Additionally, for certain variables, age groupings were consolidated to reflect the current screening recommendations, e.g. Pap smear in the past three years.

BRFSS METHODOLOGY

The Massachusetts BRFSS is a random-digit-dial (RDD) telephone survey of non-institutionalized Massachusetts adults residing in households with telephones, and from 1997 to 1999 was conducted by ORC Macro, Inc. The sampling of the survey population involved a list-assisted, stratified RDD sampling frame, which assures that Massachusetts households with telephone numbers assigned after publication of the current directories as well as households with deliberately unlisted numbers are included in the sample in appropriate proportions. This methodology is designed to more efficiently and validly reach all telephone equipped households, and to provide population estimates of health conditions and behaviors.

The BRFSS is a random telephone survey of Massachusetts adults ages 18 and older.

Telephone numbers were randomly selected, and multiple attempts were made to reach each household. To be eligible to participate in this survey, the household had to be occupied by at least one adult age 18 or older. Institutions, group quarters, and temporary residences lived in for less than one month per year were excluded from the survey. In order to provide estimates of health at the local level, additional interviews were conducted among adults residing in the following major cities in the Commonwealth: Boston, Worcester, Springfield, Lawrence, Lowell, Fall River, and New Bedford.

Once a household was contacted, one adult was randomly selected to complete the interview. No proxy respondents or substitutions were allowed in the event that the selected adult was unwilling or unable to complete the interview for any reason such as language barriers, disability, or lack of availability. In

From 1997 to 1999, 15,956 adults participated in the BRFSS. All data are weighted, and provide population-based estimates of health among Massachusetts adults.

addition to English, the survey was conducted in Spanish and Portuguese. From 1997 to 1999, 15,956 adults completed the survey. Data were weighted to reflect the probability of selection and differential participation by sex and age. All analyses presented in this report were conducted using SUDAAN and SAS software and are considered estimates for the adult population in Massachusetts. For each estimate in the core section we include a 95% confidence

interval* in order to assess the variability of the data. Since we are taking a random sample of the population, and not a complete census, 95% confidence intervals provide a range of values that most likely contain the true percent estimates for the population.

There are some limitations that should be considered when interpreting results from the BRFSS. Households that do not have a telephone do not have the opportunity to participate in the survey. Although only 2% of Massachusetts's households lack a telephone, almost 10% of households living below poverty lack a phone based on 1990 Census data. A substantial percentage of households contacted to participate in the BRFSS did not complete the survey. Although households were telephoned on repeated occasions, interviewers were not always able to reach the randomly selected adult in the household. In addition, some adults contacted did not agree to participate in the survey. We would be concerned about a bias in the results if the respondents who participated in the survey differed significantly from those not included in the survey. The weighting of the data partially takes into account this non-response.

* see glossary

All data collected by the BRFSS are based on self-report from the respondents. By its nature, self-reported data may be subject to error for several reasons. An individual may have difficulty remembering events that occurred a long time ago or the frequency of certain behaviors. Some respondents may over-report socially desirable behaviors, while underreporting behaviors they perceive to be less acceptable. Finally, because the BRFSS surveys a randomly selected sample of Massachusetts's adults, these results may differ from another random sample to some extent simply due to chance.

**DEMOGRAPHIC PROFILE OF BRFSS SURVEY RESPONDENTS:
FALL RIVER/NEW BEDFORD, 1997-1999**

From 1997 to 1999, 1121 Fall River/New Bedford residents age 18 and older completed the Massachusetts Behavioral Risk Factor Surveillance System. The BRFSS data are weighted to account for the probability of selection related to the number of telephones in the house, number of adults, and the city of residence. In addition, the data are post-stratified to the 1997 to 1999 Massachusetts intercensal population estimates by age and gender.

	UNWEIGHTED SAMPLE SIZE N	WEIGHTED PERCENT (%)

SECTION 1: OVERALL HEALTH STATUS

All respondents were asked to describe their overall health status as excellent, very good, good, fair, or poor, and they were also asked on how many days in the previous month their mental health had been poor, and how many days physical or mental health had limited their daily activities.

During 1997 to 1999, 21% of Fall River/New Bedford adults described their health as fair or poor. Older adults, and adults with lower education or income were more likely to report fair or poor health. Overall, 12% of Fall River/New Bedford adults had experienced 15 or more days of poor mental health in the previous month. Adults of lower income were more likely to have experienced 15 or more days of poor mental health in the past month. Of all Fall River/New Bedford adults, 8% were limited in their usual activities by poor physical or mental health for 15 or more days in the previous month. Adults of lower income were more likely to have had their activities limited by poor health.

CITY LEGEND

Bos	= Boston
Spr	= Springfield
Wor	= Worcester
L/L	= Lawrence/Lowell
FR/NB	= Fall River/New Bedford
Other	= Other Localities

Compared with the state as a whole, Fall River/New Bedford adults were more likely to report their health to be fair or poor. Among the selected cities, the percentage of adults reporting fair or poor health ranged from 12% in Worcester and Boston to 21% in Fall River/New Bedford (Figure 1a). Compared with the state as a whole, Fall River/New Bedford adults were more likely to have had 15 or more days of poor mental health in the past month.

The percentage of adults reporting 15 or more days of poor mental health in the past month ranged from 8% in Boston to 12% in Fall River/New Bedford (Figure 1b). Compared with the state as a whole, Fall River/New Bedford adults were more likely to have had 15 or more days in the past month on which their usual activities were limited due to poor health. Of the selected cities, the percentage of adults who reported that poor health limited their activities 15 or more days in the past month ranged from 4% in Springfield to 8% in Fall River/New Bedford (Figure 1c).

Compared with 1994 to 1996, the percentage of Fall River/New Bedford adults who reported fair to poor health, 15 or more days of poor mental health in the past month, and 15 or more days of activities limited by health in the past month were similar during 1997 to 1999 (Figure 1d).

Comparison with State-wide data, National data, and Healthy People 2010 Objectives

Healthy People 2010	N/A	N/A	N/A	N/A	N/A	N/A

SECTION 2: QUALITY OF LIFE

All respondents were asked to self-assess measures of quality of life. Respondents were asked on how many days in the previous month they had felt sad, blue or depressed, how many days pain made it hard to do usual activities, and how many days they felt very healthy and full of energy.

During 1998 to 1999, 11% of Fall River/New Bedford adults said that they had felt depressed for at least 15 days in the past month. The percentage of adults who reported feeling depressed for 15 or more days of the month increased until age 65 then decreased. Eleven percent of Fall River/New Bedford adults stated that during the past month they had experienced pain that made it hard to do their usual activities for at least 15 days. Adults ages 45 and older were more likely to have experienced 15 or more days of pain in the past month. Adults with a college degree were less likely to have had pain for at least half of the past month. Of all Fall River/New Bedford adults, 65% reported that they felt full of energy for at least 15 days of the past month. Adults of lower income were less likely to have felt full of energy for over half of the past month.

QUALITY OF LIFE AMONG FALL RIVER/NEW BEDFORD ADULTS, 1998-1999 <i>(PERCENTAGES AND 95% CONFIDENCE INTERVALS)</i>

 Other = Other Localities

Compared with the state as a whole, Fall River/New Bedford adults were more likely to have felt depressed for the majority of the past month. The percentage of adults who said that they had felt sad, blue, or depressed for at least 15 days in the past month ranged from 7% in Boston to 12% in Fall River/New Bedford (Figure 2a). Compared with the state as a whole, Fall River/New Bedford adults were more likely to have had pain that made it hard to do usual activities for at least 15 days of the previous month. The percentage of adults who had pain ranged from 6% in Boston to 11% in Lawrence/Lowell and Fall River/New Bedford (Figure 2b). Compared with the state as a whole, Fall River/New Bedford adults were less likely to have felt full of energy for most of the previous month. Among the selected cities, the percentage of adults reporting 15 or more days of full energy ranged from 65% in Fall River/New Bedford to 71% in Worcester (Figure 2c).

Questions on quality of life were not asked in the 1994 to 1996 surveys and therefore data on these measures are not available for comparison.

SECTION 3: HEALTH ACCESS AND UTILIZATION

All respondents were asked whether they currently had health insurance and whether they were unable to see a doctor in the past year due to cost.

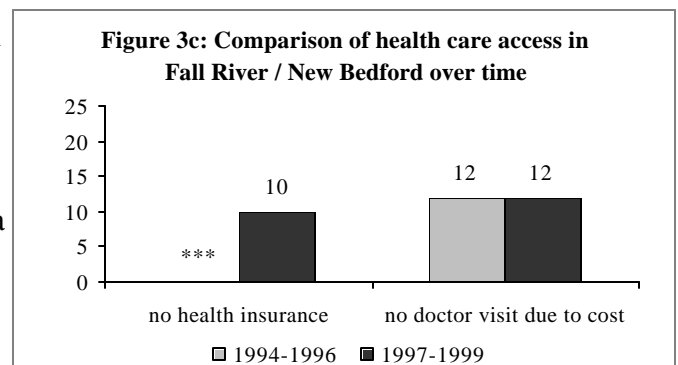

During 1997 to 1999, 10% of Fall River/New Bedford adults reported having no health insurance coverage. Younger adults were more likely to be without health insurance. Adults with a college education were less likely to be uninsured. Overall, 12% of Fall River/New Bedford adults had not seen a doctor in the previous year due to the cost. The percentage of adults who had not seen a doctor due to the cost in the past year decreased with increasing education and income levels.

† Insufficient sample size

Compared with the state as a whole, Fall River/New Bedford adults were less likely to have health insurance coverage. Among the selected cities, the percentage of adults reporting no health insurance ranged from 7% in Boston and Worcester to 10% in Springfield, Lawrence/Lowell, and Fall River/New Bedford (Figure 3a). Compared with the state as a whole, Fall River/New Bedford adults were more likely to have not visited the doctor in the past year due to the cost. The percentage of adults who had not been to the doctor in the previous year due to the cost ranged from 9% in Boston and Worcester to 15% in Lawrence/Lowell (Figure 3b).

Other	= Other Localities

*** Health insurance was calculated differently in 1999 compared with previous BRFSS reports. In previous reports respondents were classified as having no insurance if they answered no to the following question: “Do you have any kind of health care coverage, including health insurance, prepaid plans such as HMOs, or government plans such as Medicare?” In 1999, respondents were classified as having no insurance if they responded no to this question and no to the following question: “There are some types of health insurance you may not have considered: Please tell me if you have any of the following:[respondent read list of types of insurance]”. Estimates generated for this report are therefore not comparable to estimates generated for earlier BRFSS reports. The effect of adding the second question was to lower the percentage of Fall River/New Bedford adults with no health insurance from 15% to 10% during 1997-1999.

Compared with 1994-1996, the percentage of Fall River/New Bedford adults who did not see the doctor during the year due to the cost was similar during 1997-1999 (Figure 3c). Fall River/New Bedford did not meet the Healthy People 2010 objective for the percentage of adults who have no health insurance.

SECTION 4: DENTAL HEALTH

All respondents were asked questions related to dental health. Respondents were asked when they had last visited a dentist and how many teeth they had lost due to decay or gum disease.

During 1998 to 1999, 62% of Fall River/New Bedford adults reported having gone to the dentist in the previous year. Women and adults of higher income were more likely to have been to the dentist in the previous year. Hispanics were more likely than White non-Hispanics to have been to a dentist in the past year. Overall, 27% of Fall River/New Bedford adults reported having six or more teeth missing due to disease or decay, and the percentage increased with age. Adults of lower income were more likely to have six or more teeth missing due to disease or decay. White non-Hispanics were more likely than Hispanics to have had six or more teeth missing due to disease or decay.

SECTION 5: TOBACCO USE

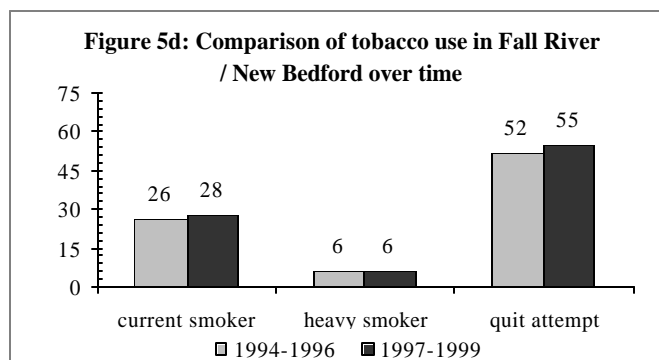

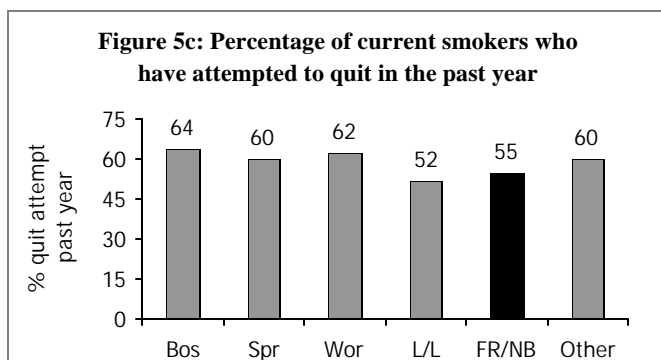

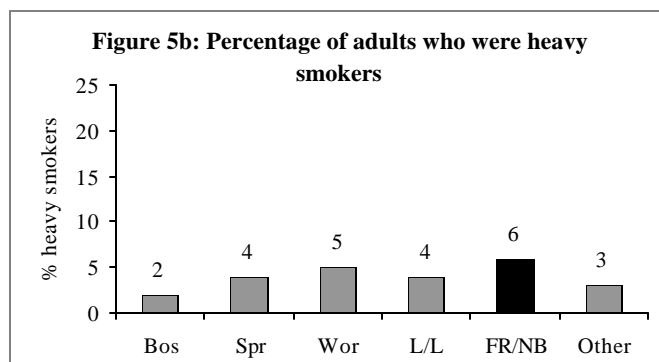

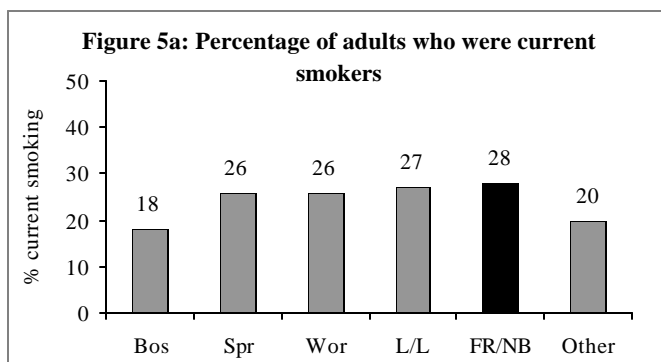

All respondents were asked whether they had smoked 100 cigarettes in their lifetime and whether they currently smoked daily, some days, or not at all. All current smokers were asked the number of cigarettes they smoked per day. Heavy smoking was defined as smoking 21 or more cigarettes per day, or more than one pack. All current smokers were also asked if they had quit smoking for at least one day during the course of the previous year.

During 1997 to 1999, 28% of Fall River/New Bedford adults were current smokers. Adults ages 65 and older and adults with a college education were less likely to be current smokers. Of all Fall River/New Bedford adults, 6% were heavy smokers. Women and adults ages 65 and older were less likely to be heavy smokers. Fifty-five percent of current smokers in Fall River/New Bedford have attempted to quit smoking during the previous year.

¹ Among current smokers only

Compared with the state as a whole, Fall River/New Bedford adults were more likely to be current smokers. Among the selected cities, the percentage of adults who are current smokers ranged from 18% in Boston to 28% in Fall River/New Bedford (Figure 5a). Fall River/New Bedford adults were more likely than adults from the state overall to be heavy smokers. The percentage of adults who were heavy smokers ranged from 2% in Boston to 6% in Fall River/New Bedford (Figure 5b). The percentage of Fall River/New Bedford adults who had tried to quit smoking at some point in the preceding year was similar to that of the state overall. Among the selected cities, the percentage of adults who attempted to quit in the past year ranged from 52% in Lawrence/Lowell to 65% in Boston (Figure 5c).

SECTION 6: ENVIRONMENTAL TOBACCO

All respondents were asked whether they felt that smoking in restaurants should be allowed without restriction, only in designated areas, or not at all. Respondents were also asked whether smoking is allowed in their own home.

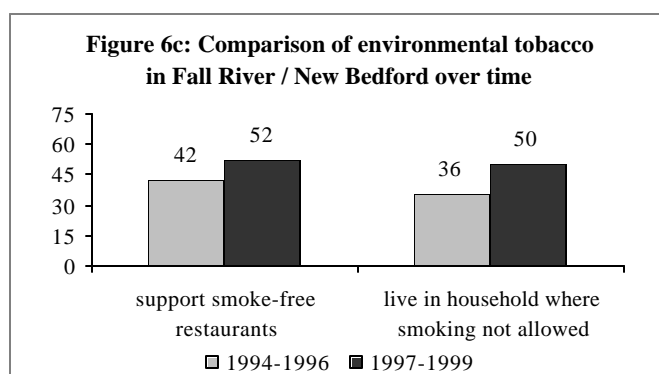

During 1997 to 1999, 52% of Fall River/New Bedford adults supported smoke-free restaurants. Hispanics were more likely than White non-Hispanics to support smoke-free restaurants. Overall, 50% of Fall River/New Bedford adults live in households where smoking is not allowed. Older adults and adults with a college degree were more likely to live in households where smoking is not allowed. Hispanics were more likely than White non-Hispanics to live in a household where smoking was not allowed.

SECTION 7: ALCOHOL USE

All respondents who had reported having had at least one drink in the past 30 days were asked if they had consumed 5 or more drinks on one occasion in the past month (binge drinking). Respondents were also asked how many drinks they have had in the past 30 days, and whether or not they had driven at some point when they felt they had too much to drink.

During 1997 and 1999, 13% of Fall River/New Bedford adults had consumed five or more drinks on one occasion in the past month (binge drinking). Men and younger adults were more likely to report binge drinking. Overall, 3% of Fall River/New Bedford adults reported having had 60 or more drinks over the previous 30 days (heavy drinking). Men were more likely to report heavy drinking in the preceding month. Three percent of Fall River/New Bedford adults reported that they drove when they had consumed too much alcohol. Men were more likely to have driven when they had too much to drink. Hispanics were less likely than White non-Hispanics to have driven when they drank too much during the past month.

† Insufficient sample size

Compared with the state as a whole, Fall River/New Bedford adults were less likely to report binge drinking in the past 30 days. Among the selected cities, the percentage of adults who reported binge drinking in the past month ranged from 13% in Fall River/New Bedford to 22% in Boston (Figure 7a). Compared with the state as a whole, a similar percentage of Fall River/New Bedford adults reported heavy drinking in the past month.

Among the selected cities, the percentage of adults who reported heavy drinking in the past month ranged from 3% in Fall River/New Bedford to 6% in Worcester (Figure 7b). Compared with the state as a whole, a similar percentage of Fall River/New Bedford adults have driven after drinking too much in the past month. The percentage of individuals who drove after drinking too much ranged from 2% in Boston and Springfield to 4% in Worcester (Figure 7c).

Compared with 1995, the percentage of Fall River/New Bedford adults who have had five or more drinks on one occasion, consumed sixty or more drinks, or drove after having had too much to drink in the past month were similar during 1997 and 1999 (Figure 7d). Fall River/New Bedford did not meet the Healthy People 2010 objective for five or more drinks on one occasion.

SECTION 8: WEIGHT CONTROL

All respondents reported their own height and weight. Using Body Mass Index (BMI), calculated by dividing weight in kilograms by height in meters squared, we categorized all adults on weight status. Based on the Healthy People 2010 objectives (HP 2010), both men and women were categorized as overweight with BMI > 25, and as very overweight with BMI > 30.

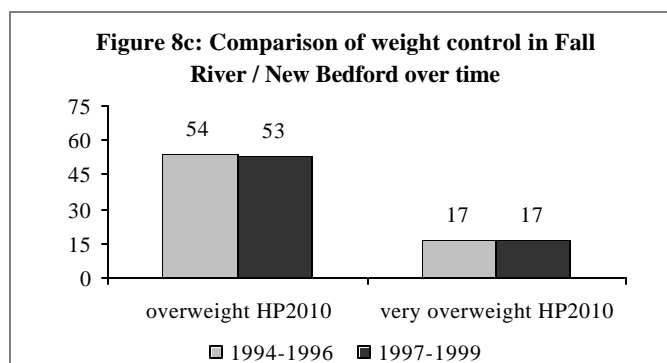

During 1997 to 1999, 53% of Fall River/New Bedford adults were overweight by the HP 2010 objective. Men were more likely than women to be overweight. Neither education nor income was associated with being overweight in this population. Seventeen percent of Fall River/New Bedford adults were very overweight by the HP 2010 objective. Younger adults were less likely to be very overweight based on the HP 2010 objective.

† Insufficient sample size

Compared with the state as a whole, a similar percentage of Fall River/New Bedford adults were overweight by the Healthy People 2010 objective. Among the selected cities, the percentage of overweight adults ranged from 46% in Boston to 58% in Springfield (Figure 8a). Fall River/New Bedford adults were as likely as adults of the state overall to be very overweight by the Healthy People 2010 objective. Among the selected cities, the percentage of adults who were very overweight ranged from 14% in Boston and Worcester to 19% in Springfield (Figure 8b).

Compared with the years 1994 to 1996, the percentage of overweight adults and very overweight adults were similar among all Fall River/New Bedford adults during 1997 to 1999 (Figure 8c). Fall River/New Bedford did not meet the Healthy People 2010 objective for overweight or very overweight adults.

SECTION 9: HIGH BLOOD PRESSURE AWARENESS

All respondents were asked when they last had their blood pressure checked by a health professional. Those who ever had their blood pressure checked were asked whether they had ever been told they had hypertension, or high blood pressure.

During 1997 and 1999, 95% of Fall River/New Bedford adults had their blood pressure checked within the past 2 years. Among adults who have had their blood pressure checked, 24% had been told by a health professional that they have high blood pressure. The percentage of adults with high blood pressure increased with increasing age. Adults of lower income were more likely to have high blood pressure.

SECTION 10: CHOLESTEROL AWARENESS

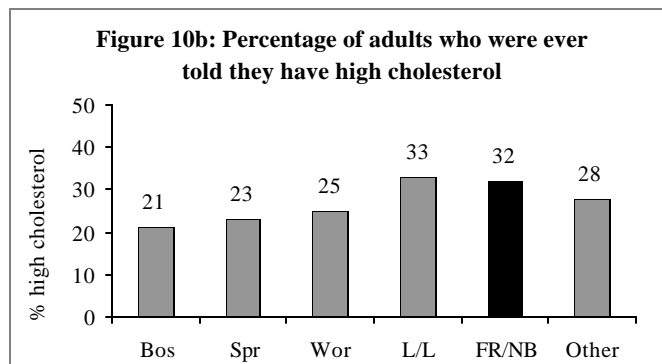

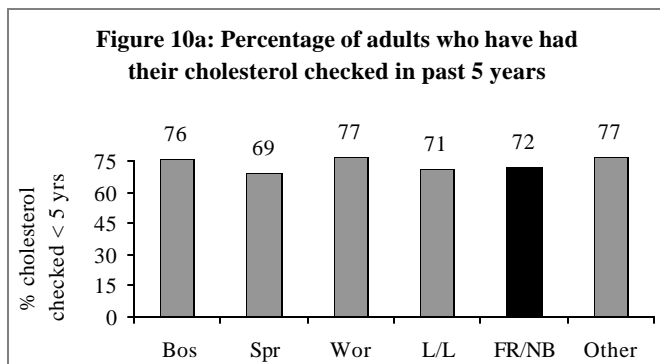

All adults were asked if they had ever had their blood cholesterol checked, and if so, when the last time it was checked. Respondents who had ever had their cholesterol checked were also asked if a doctor or other health professional had ever told them that they had high cholesterol.

During 1997 and 1999, 72% of Fall River/New Bedford adults reported having had their blood cholesterol checked within the past 5 years. Men and adults ages 18 to 44 were less likely to have had their blood cholesterol checked in the past five years. The percentage of adults who have had their blood cholesterol checked in the past five years increased with increasing income. Thirty-two percent of Fall River/New Bedford adults reported having been told that they had high cholesterol. The percentage of adults with high cholesterol increased with increasing age.

*** Data not available for 1994-1996

Compared with the state as a whole, Fall River/New Bedford adults ages 50 and older were less likely to have ever had a blood stool test. Among the selected cities, the percentage of adults ages 50 and older who had a blood stool test ranged from 34% in Fall River/New Bedford to 51% in Worcester (Figure 11a). Fall River/New Bedford adults ages 50 and older were about as likely to have had a blood stool test in the past two years as adults ages 50 and older of the state overall.

Among the selected cities, the percentage of adults ages 50 and older who had a blood stool test in the past two years ranged from 27% in Lowell / Lawrence to 41% in Worcester (Figure 11b). Compared with the state as a whole, Fall River/New Bedford adults ages 50 and older were less likely to have had sigmoidoscopy or proctoscopy in the past five years. Among the selected cities, the percentage of adults ages 50 and older who have had sigmoidoscopy or proctoscopy in the past five years ranged from 26% in Fall River/New Bedford to 33% in Boston and Worcester (Figure 11c).

Compared with 1995, the percentage of Fall River/New Bedford adults who have had a sigmoidoscopy or proctoscopy in the past 5 years was similar during 1997 and 1999 (Figure 11d). Fall River/New Bedford did not meet the Healthy People 2010 objective for the percentage of adults who have had a blood stool test in the past two years.

SECTION 12: CHRONIC DISEASE

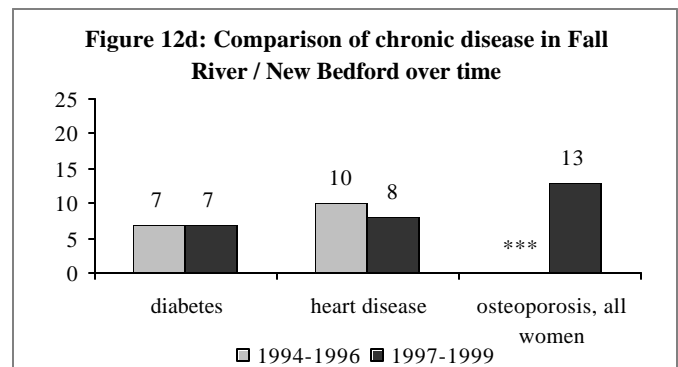

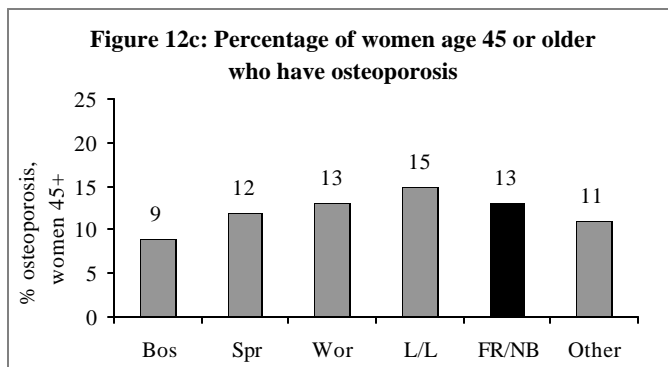

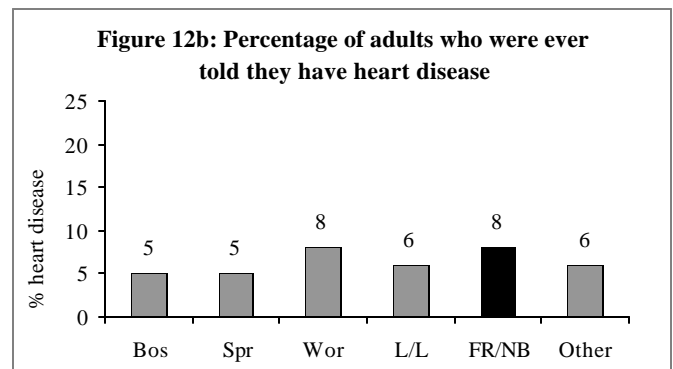

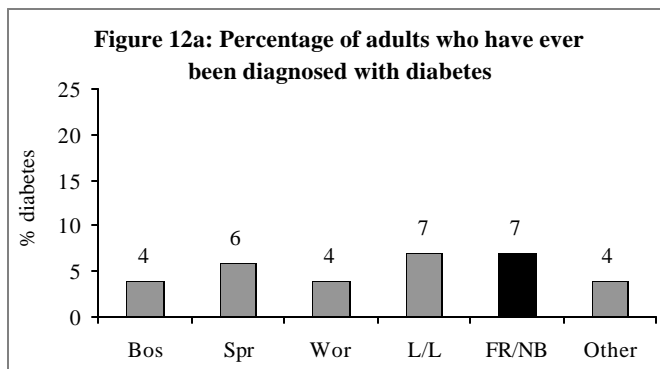

All respondents were asked if they had ever been told by a doctor that they have diabetes or heart disease. Women who had diabetes only during pregnancy were considered to not have diabetes. All women age 45 and older were asked if they had ever been told that they had osteoporosis.

During 1997 to 1999, 7% of Fall River/New Bedford adults had been told by a doctor that they have diabetes. The percentage of adults with diabetes increased with increasing age. Overall, 8% of Fall River/New Bedford adults had been told they have heart disease. Adults aged 45 and older were more likely to have heart disease. Thirteen percent of Fall River/New Bedford women age 45 and older had been told they have osteoporosis. The percentage of women age 45 and older with osteoporosis increased with increasing age. White non-Hispanic women were more likely to have osteoporosis.

¹ Data available for 1997 and 1998 only.

*** Data unavailable for 1994-1996

Compared with the state as a whole, Fall River/New Bedford adults were more likely to have diabetes. Among the selected cities, the percentage of adults with diabetes ranged from 4% in Boston and Worcester to 7% in Lawrence/Lowell and Fall River/New Bedford (Figure 12a). Compared with the state as a whole, a similar percentage of Fall River/New Bedford adults had heart disease. Among the selected cities, the percentage of adults with heart disease ranged from 5% in Boston and Springfield to 8% in Worcester and Fall River/ New Bedford (Figure 12b).

Compared with the state as a whole, a similar percentage of Fall River/New Bedford women ages 45 and older had osteoporosis. Among the selected cities, the percentage of women ages 45 and older who had osteoporosis ranged from 9% in Boston to 15% in Lawrence/Lowell (Figure 12c).

Compared with 1994 to 1996, the percentages of Fall River/New Bedford adults with diabetes or heart disease were similar during 1997 to 1999 (Figure 12d). Osteoporosis data were unavailable for 1994 to 1996. Fall River/New Bedford did not meet the Healthy People 2010 objective for diabetes.

SECTION 13: DISABILITY AND LIMITATIONS

All respondents were asked about their disabilities and activity limitations. Respondents were defined as having a limitation or disability if they had an impairment or health problem that limited activities or caused cognitive difficulties, if they used special equipment or help from others to get around, or if they said they had a disability of any kind. Individuals who reported a limitation or disability were asked how long they had the impairment and if they needed help in handling routine needs or personal care.

During 1997 to 1999, 22% of Fall River/New Bedford adults reported having a disability or limitation for at least one year. Adults ages 18 to 44 were less likely to have a disability. Adults of lower income or less than a high school education were more likely to have a disability. Eight percent of Fall River/New Bedford adults reported having a limitation or disability that required help with daily activities. The percentage of adults with disability and in need of help with daily activities increased with increasing age. Women and adults of lower income were more likely to have a disability and in need of help with daily activities.

SECTION 14: BREAST CANCER SCREENING

All female respondents were asked about frequency of breast cancer screening. This analysis examines the percentage of women ages 40 and older who ever had a mammogram, the percentage of women ages 50 and older who have had a mammogram in the past two years, and the percentage of all women who have had a clinical breast exam (CBE) within the past two years.

From 1997 to 1999, 90% of Fall River/New Bedford women ages 40 and older ever had a mammogram. Eighty-five percent of all Fall River/New Bedford women ages 50 and older have had a mammogram within the past two years. Of all Fall River/New Bedford women, 78% reported having had a clinical breast exam in the previous two years. Women with less than a high school education were less likely to have had a clinical breast exam in the past two years.

SECTION 16: INTIMATE PARTNER ABUSE

During 1997 and 1998, all women ages 18 to 59 were asked questions about physical or emotional abuse, and during 1999, all adults ages 18 to 59 were asked these questions. This analysis examines the percentage of women ages 18 to 59 experiencing intimate partner abuse, defined as having been physically hurt, threatened or controlled by a current or ex - husband, live - in partner, or boyfriend or girlfriend in the past year.

During 1997 to 1999, 6% of Fall River/New Bedford women ages 18 to 59 reported intimate partner abuse in the past year. The percentage of women who have experienced partner abuse decreased with increasing age.

SECTION 17: HIV / AIDS RISK AND TESTING

All adults ages 18 to 64 were asked to assess their risk of contracting HIV, the virus that causes AIDS. All adults ages 18 to 64 were also asked if they had ever been tested for HIV, and if they had been tested in the past year.

Overall, 13% of Fall River/New Bedford adults said they had a medium to high risk of HIV infection. Women were less likely to feel at medium or high risk of HIV infection. Hispanics were more likely than White non-Hispanics to report being at medium to high risk of HIV. Of all Fall River/New Bedford adults ages 18 to 64, 48% have ever had an HIV test. The percentage of adults who have had been tested for HIV decreased with increasing age. Seventeen percent of adults have been tested for HIV in the past year. Women, adults ages 18 to 29, and adults of lower income were more likely to have been tested for HIV within the past year.

GLOSSARY

Confidence Interval: The BRFSS surveys a random sample of the Massachusetts adult population and generalizes the results to estimate the true prevalence of disease or behaviors of the entire population. Two successive surveys of the same population may not yield the same estimate of a health behavior, simply due to the random selection process. For example, if we conduct two identical surveys of smoking prevalence at the same time, we may have two different estimates smoking prevalence, even though the true underlying proportion of smokers in the population is unchanged.

The percent estimate usually provides a good approximation of the underlying truth, although there are a range of values that may be consistent with the data. This range is called a confidence interval. A 95% confidence interval can be considered to be a range of values that has a 95% chance of including the true proportion, given that the data were not biased in any way. The confidence interval describes the precision of an observed estimate of the underlying proportion, with a wider interval indicating less certainty about this estimate. The main factor affecting the width of the confidence interval is the number of respondents.

A 95% confidence interval can be considered a range of values that has a 95% chance of including the true proportion.

Readers should note that not all values within the confidence interval are equally likely. Values close to the estimate are more likely than values near the end points of the confidence interval. For example, the estimate for the percent of adults in Massachusetts who are current smokers is 20.2%. The 95% confidence interval for this estimate is 18.9 - 21.5%. However, upon repeated surveys, half of the values would be expected to fall within the range 19.7- 20.6%.

Healthy People 2010 Objectives: The Healthy People 2010: National Health Promotion and Disease Prevention Objectives are a national agenda that aim to significantly improve the health of Americans in the decade preceding the year 2010. Developed through an extensive governmental, professional, and public national process, Healthy People 2010 defined two broad national goals: to increase quality and years of healthy life and to eliminate health disparities. These goals were supported by 476 specific objectives that set priorities for public health during first decade of the 2000's. The objectives were organized into 28 priority areas such as tobacco, overweight, and diabetes.

Healthy People 2010 seeks to: increase quality and years of healthy life, to reduce health disparities.

For each objective, a numeric national target for the year 2010 was set. For each health status indicator in this report that has a corresponding Healthy People 2010 Objective, the year 2010 target is shown in the relevant graphs and tables.

Median: The median is the middle observation for a set of observations; i.e. the value that divides the frequency distribution into halves. It is also equal to the 50th percentile. For example, the US median represents the point at which half of the states have a higher estimate than the median and half have a lower estimate.

KEY LINKS

Health Survey Program: The Health Survey Program is part of the Bureau of Health Statistics, Research and Evaluation at the Massachusetts Department of Public Health. Additional information about the program including other state publications can be found on our website located at: <http://www.state.ma.us/dph/bhsre/cdsp/brfss/brfss.htm>, link to our program.

MassCHIP: Data on selected variables from the Massachusetts BRFSS are available through the Massachusetts Community Health Information Profile (MassCHIP), an Internet - accessible information service available from the Massachusetts Department of Public Health. Information about how to register as a MassCHIP user is available at: <http://masschip.state.ma.us/>.

National BRFSS data: There is a national BRFSS website as part of the Centers for Disease Control and Prevention, which provides information about the BRFSS, includes listings of publications and questionnaires, provides national data on selected variables, and includes links to relevant websites. The national BRFSS website is located at: www.cdc.gov/nccdphp/brfss/. A downloadable document that describes all aspects of the BRFSS and survey methodology is located at: <http://www.cdc.gov/nccdphp/brfss/pdf/userguide.pdf>.

Healthy People 2010 website: The Healthy People Objectives has been coordinated by the U.S. Department of Health and Human Services, Office of Disease Prevention and Health Promotion. Information on the health prevention goals, priority areas, measuring progress in the health indicators and other pertinent information can be found on the Healthy People 2010 homepage at: <http://www.health.gov/healthypeople/>.

ACKNOWLEDGEMENTS

This report was prepared by the staff of the Health Survey Program:

Jason Yeaw, BS, Research Analyst
Lorelei Mucci, MPH, Research Analyst
Phyllis Brawarsky, MPH, Research Analyst
Brian Bradbury, MPH, Research Analyst
Karen Clements, MPH, Research Analyst

We wish to express our gratitude to the residents of Massachusetts who participated in this survey, and to ORC Macro, Inc. and the dedicated interviewers who helped make this survey possible.

For further information about this report, about the BRFSS, or the Health Survey Program, please contact: Zi Zhang, MPH. Health Survey Program. Bureau of Health Statistics, Research, and Evaluation. Massachusetts Department of Public Health. 250 Washington Street, 6th floor. Boston, MA 02108 - 4619. telephone: (617) 624 - 5623. email: zi.zhang@state.ma.us.
